The Action Manager Limited

Security Statement

8 August 2008

TAM utilises some of the most advanced technology for Internet security available today. When you access our site using a compatible web browser, Secure Socket Layer (SSL) technology protects your information using both server authentication and data encryption, ensuring that your data is safe, secure, and available only to registered Users in your organisation. Unless you decide to allow others access, your data will be completely inaccessible to your competitors and other third parties.

In addition to the unique Client ID your organisation has been given, TAM provides each User in your organisation with a unique username and password that must be entered each time a User logs on. TAM issues a session "cookie" only to record encrypted authentication information for the duration of a specific session. The session "cookie" does not include either the username or password of the user. TAM does not use "cookies" to store other confidential user and session information, but instead implements more advanced security methods based on dynamic data and encoded session IDs.

In addition, TAM is hosted in a secure server environment that uses a firewall and other advanced technology to prevent interference or access from outside intruders.
